**It is Very Difficult to Do Nothing, Notes on Laziness**

---

Scientists say the future will be more futuristic than originally predicted. As the saying goes: Time is money. That means that there is a convertibility of time into value, and this value is nothing other than its capacity to be redeemed for other time. That's how the economy works. When I buy a commodity, I'm essentially buying the time it took for it to be produced, I'm consuming someone else's time. Laziness or idleness falls out of this economy, and for that reason it is strictly worthless. But that also means it can have the highest, incomparable value: laziness is non-time but also time at its purest.
